Features and Benefits

Vacuum Measurement for Science and Industry

Agilent vacuum gauges and controllers are reliable, accurate, and cost-effective tools for measuring and controlling vacuum pressure in a wide range of applications.

- Agilent features pressure measurement technology designed for challenging industrial environments: simplicity, rugged design, plus ease of service to insure maximum productivity and uptime in your vacuum system or vacuum process.
- With over 50 years experience in science research, our superior accuracy and stability meets the most demanding scientific requirements, and Agilent can provide the ultimate in measurement precision through our STARRS calibration and support program.

XGS-600 Gauge Controller

- Intuitive screen functions
- Displays up to 8 gauges on one screen
 - Customizable gauge labels

Vacuum Measurement

Intelligent Design & Functionality

- Simultaneous operation of all gauges
 - up to 12
 - < 20 millisecond signal-to-set- point response time
 - Displays up to 8 gauges at one time
- Standard features include:
 - 8 gauge set points
 - fully programmable RS-232/485 serial communications
 - E-beam degas for hot filament gauges
 - pressure unit selection: Torr, mbar, Pascal
 - universal voltage compatability
 - analog output

Rough Gauge Controllers

Reliable, cost-effective solutions for pressure measurement from 1×10^{-3} Torr to 760 Torr, these controllers come with the Agilent TC tube and cable and are pre-calibrated.

- Ready to install and operate.
- Two easily configured set points to facilitate critical operations.
- Large, bright LED display is easily read across a room or in dimly lit locations.

Easy key pad navigation

Capacity, Flexibility & Expandability

Only 3 gauge cards operate all Agilent gauges:

- Add a gauge card when needed, simply and quickly
- Save the cost of additional controllers

Simultaneous operation of:

- Up to 4 hot filament gauges plus 4 convection gauges
- Up to 5 inverted magnetron gauges
- Up to 12 convection gauges

Active Gauge Controllers

These single channel controllers operate the FRG-, PVG-, PCG-, and CDG-series of Active Gauges. Both provide user selectable measurement units and adjustable set point control.

- Easy to set up.
- Automatically identify the gauge type when connected.
- Adjustable set point control enable critical process steps or operations.

Vacuum
Measurement

Applications

Physics R&D, Accelerators

- **Synchrotron Light Sources and Beam Lines**
- **Particle Accelerator Rings**

Vacuum gauges are widely used in High Energy Physics, Fusion Technology and general UHV research. Synchrotron Light Sources, Particle Accelerator Rings, UHV Laboratory research, and Fusion reactors need extremely accurate, reliable and cost effective HV and UHV gauges. Agilent offers a full range of vacuum transducers that can be equipped with high function controllers to monitor and control HV and UHV environments. If desired, Agilent also offers "Active Gauges" equipped with on-board controllers that combine highly accurate and compact vacuum measurement and control in the smallest footprint.

Industrial Processes

- **Thin Film Deposition**
 - glass coating equipment (architectural glass, automotive glass, flat panel display substrates)
 - thin film solar cells production (photo-voltaic)
 - optical data media (Compact Discs, Digital Versatile Discs, Magneto Optical Discs)
- **Magnetic storage media (hard discs, read heads)**
- **Surface treatments (functional, decorative)**
- **Optical coating (ophthalmic, precision opto-electronics)**
- **Roll/web coating on films or foils**

In order to assure that a thin film process (PVD/sputtering) is reproducible it is necessary to measure parameters that relate to total gas pressure, which is a function of gas density and temperature, and the partial pressure of the individual gas species. These vacuum parameters should be measured precisely both during pump down to base pressure and during processing as processing often releases gas into the deposition environment.

In crowded chambers at higher pressures (>1mTorr), significant pressure differential can exist in the processing

Plasma vapour deposition (PVD). Worker adjusting the controls of a PVD machine which is being used to coat components (trays at lower centre and lower left) with a thin film metal alloy to provide a wear-resistant coating.

chamber. These pressure differentials can affect film properties such as residual stress, composition, electrical resistivity, etc. In sputter deposition systems, when establishing a plasma, such pressure differences can change the plasma density and thus the sputtering rate, thereby affecting the film composition deposition. In such circumstances several gauges may be used at different locations in the processing chamber to monitor the pressure differences.

- **Device Processing**
 - TV and monitor picture tube manufacture
 - Evacuation and coating of lamps (motorway lighting, beamers)
 - X-Ray tubes & electron devices (CPI, etc)
 - Medical accelerator tubes (medical devices)
 - Lasers, night vision systems
 - Cryogenic processes and instrumentation
 - Infrared detectors (DRS)
- **General Industrial Processes**
 - Vacuum furnaces – Metallurgy

Vacuum Furnaces for Metal Treatment

Brazing, sintering or annealing metals requires an atmosphere free of oxygen. Therefore, such processes are carried out under partial vacuum using inert gas. The vacuum level must be monitored and kept constantly low during the process in order to avoid oxidation of the products. As a result, it is necessary to measure the pressure in the high vacuum furnace near the gas inlet as well as at the vacuum port with high accuracy. Agilent active convection gauges with wide measuring range can detect the pressure at the furnace gas inlet and vacuum port with excellent precision. They are then linked to the system PLC by their serial port with either RS-232 or 485 communication. Based on this, all system pressure levels can be monitored at the main control system. This allows easy monitoring of the system gradient inside the furnace.

Vacuum Measurement

Scanning electron microscopes, like the one shown here, can "see" details as small as one nanometre – one millionth of a metre!

Nanotechnologies & Semiconductor Manufacturing

- **Electron Microscopy (SEM, TEM)**
- **Focused Ion-beam Systems (FIB) and Surface Analysis**
- **Semiconductor manufacturing**

Modern focused-beam systems such as SEMs, TEMs and FIB's utilize columns that project electrons or ions onto microscopic samples for detailed analysis. End users analyze all types of substances from organic compounds to semiconductor wafers. A key requirement is high sample throughput in order to lower the cost of ownership of these instruments. Agilent offers a full range of high and ultra-high vacuum gauges designed especially for the demanding requirements of SEMs, TEMs and surface analysis systems. Vacuum gauges are also a key component in modern focused-beam systems because the process gas flow can cause significant fluctuations in chamber pressures demanding a wide range of control. Agilent offers a full range of application specific SEM vacuum gauges for easy system integration and flexibility, or gauge controllers for systems that do not have integrated control systems or require dedicated remote read-out.

For the majority of semiconductor manufacturing processes, vacuum system operation usually can be enhanced through good vacuum control to improve reliability, throughput, uptime, contamination control, and process control. For example, a vacuum pump-down or purge cycle often can be shortened without degrading the product, and the time saved can significantly increase throughput. Agilent's complete line of on-board, direct measurement gauges can be easily integrated into existing OEM system controllers through digital or analog control, assuring the ability to meet demanding rapid cycle applications, such as vacuum load locks, in which high gas-load cycling and high tolerable foreline pressures are critical to the success of the process.

An NRC researcher uses a liquid chromatography-mass spectrometry system to quantify toxins in shellfish samples.

Analytical Instrumentation

• Mass Spectrometry

Mass Spectrometry has become an important analytical tool in many industries including pharmaceuticals and life sciences. Thanks to advances in electronics, instrument designers can implement cost-effective, high-performance analytical power in a cost-effective, easy-to-use system. These developments require advanced vacuum systems that are characterized by multi-chamber, high throughput designs on the high quality instruments.

Mass Spectrometers must operate with high accuracy and reliability. Periodic offset adjustment under fine vacuum conditions guarantees that even slightest hints of contamination can be detected. The precise Pirani vacuum transducer controls whether the required vacuum level for zero adjustment is achieved. With its elastic helix filament and the rugged metal housing the transducer is especially durable.

Agilent Gauge Controller

Agilent XGS-600

The XGS-600 Vacuum Gauge Controller provides unprecedented capacity, performance and flexibility in a cost effective, standard half-rack package. A single controller can simultaneously operate up to four hot filament (or four cold cathode) gauges and four convection gauges, up to five cold cathode gauges, or up to twelve convection gauges. Expansion or re-configuration in the field is easy to do. Serial communications (RS-232 or RS-485), eight set points, and universal voltage compatibility are

standard in all units. A programmable dot matrix LCD provides display flexibility, and simple screen organization and navigation makes the unit extremely easy to use. Drop down gauge selection automatically sets the emission current, sensitivity and overpressure. The screen displays up to eight gauges and pressures simultaneously, and permits the user to label each gauge. A large-font feature provides visibility from up to 20 feet.

Features

Benefits

• Powerful	• A single unit can simultaneously operate up to: <ul style="list-style-type: none">– 4 BA and 4 convection gauges (or 4 IMG and 4 convection gauges)– 5 ion gauges (5 IMG gauges or 4 hot filament and 1 IMG)– 12 Convection gauges– 12 Agilent Active gauges • 8 set points
• Flexible	• Standard Features in every unit: <ul style="list-style-type: none">– Serial communication (RS-232 and RS-485), universal voltage, Degas • Operates hot filament, inverted magnetron (cold cathode), convection gauges and all Agilent Active gauges
• Easy to Use	• Can mix and match any gauges in a single unit
• Fast	• Can expand or reconfigure easily in the field
• Compact	• Optional card supports Profibus DP communications protocol
	• Simple screen organization and navigation
	• Drop down gauge selection automatically sets the emission current, sensitivity and overpressure.
	• Displays up to 8 gauges simultaneously on one screen
	• Large font feature allows display of 2 gauges visible from 15-20 feet
	• Capability of programming your own 5 character gauge label
	• Set Point Screen: displays and adjusts set points for up to 8 gauges
	• < 20 milliseconds from signal to set point response
	• All in the impressively small half-rack package

Vacuum Measurement

XGS-600 Controller operates all Agilent gauges with only 3 gauge cards... convection, hot filament and cold cathode (inverted magnetron)

Laboratory

- Easy to use – can be operated without a manual; screens and menus are easy to follow
- Easy to order – only 3 different controller gauge cards/modules to choose from, everything else is standard
- Easy to adapt – only one gauge card is needed to operate any Agilent gauge of a given type
- Practical – the XGS-600 can be easily reconfigured – it just takes a few minutes to add or remove a gauge card – any Agilent gauge can be operated in one unit
- Convenient – view up to 8 gauges at one time or change the font to view 2 from 15 feet away – all programming is stored in flash memory so no battery backups are needed

Possible Configurations

Below are examples of ways to configure the XGS-600, but remember, you are not limited to these configurations. The flexibility of this unit allows you to setup the controller with the gauges that suit your needs.

Accelerators, Synchrotrons and Other Large Facilities

- Signal response – <20 milliseconds from signal to set point response – ideal for fast acting valves
- Capacity – operates up to 5 IMG gauges in one controller
- Compact – half-rack size saves up to 50-75% of rack space from other controller options
- Operability – fully programmable serial communications with individual gauge labeling; choice of RS-232/485
- Flexibility – combine UHV/HV metrology and IMG interlocking in one unit – ideal in beamline applications

OEM Equipment

- Reliable – The XGS-600 controller has been qualified under demanding test standards; thermal management reduces component stress and provides consistency and durability in performance.
- Compact – half-rack size for up to 4 ion gauges and 4 convection gauges in one unit
- Flexibility – operates any Agilent gauge in one controller
- Performance – fully programmable serial communication is standard. Serial response time <2 milliseconds. Displays up to 8 gauges in one screen, gauge labeling. All programming stored in flash memory – no batteries needed.

Agilent Gauge Controller

Agilent XGS-600

Dimensions: millimeters (inches)

Technical Specifications

User interface	LCD monochrome dot matrix, 240 x 128, white LED backlight; 5 button keypad
Display capability	Up to eight simultaneous channels of pressure measurement, up to a 5 character user label for each; up to two channels in a large font; readable from 15 feet; display updates every 200 msec
Gauge capability	Up to 4 Hot Filament BA gauges including metal, glass, and nude UHV types using the HFIG** cards; up to 5 IMGs* using the IMG* cards; up to 12 rough gauges using the Dual Convection Gauge Cards; up to 12 Active Gauges using Dual Analog Input Cards
Measurement range	1 x 10 ⁻¹¹ Torr to Atm dependent upon card and gauge type selected
Setpoints	Eight normally open setpoints (open collector), with independently programmable ON and OFF delays, manual override (see detail specs for ratings)
Fast setpoint response	20 msec max (with delay set to 0.0 secs)
Serial communications	RS232 and RS485 (fully programmable), Profibus DP (optional)
Analog outputs	1v/dec LOG, 0 – 10 V FS, on each card with 200 msec update rate
I/O control	HFIG** card: Remote gauge ON/OFF, Fil select, DeGAS ON/OFF Inputs, Status Output IMG* card: Remote gauge ON/OFF Input, Status Output Dual Convection Card: Remote CAL inputs, Status Outputs Dual Analog Input Card: Remote CAL Inputs, Status Output
Other	Auto-ON capability for installed ion gauges when at least one convection card is installed Sensitivity, gas correction, emission current (BA gauges only) inputs for ion gauges E-BEAM degas, with auto turn off for BA gauges Selectable air or argon calibration for rough gauges Adjustable atmosphere value for rough gauges Text error messages All data stored in FLASH non-volatile memory requiring no batteries
Power input/Temperature	Worldwide universal power input, 100-240 VAC, 2 A, 50/60 Hz, IEC inlet; 5-40 °C ambient
Regulatory approvals	CE certified and RoHS compliant, BV certified for USA and Canada

Vacuum Measurement

Ordering Information

Description	Part Number
XGS-600 Vacuum Controller, without cards	XGS600H0M0C0
Configure your XGS-600 Controller with cards – constructing your part number:	XGS600HXMCCX
1 Refer to the Gauge Selection Chart to help determine the gauge you need	
2 Choose the number of HFIG** cards you want; place after the "H"; will be 0 to 4	
3 Choose the number of IMG* (cold cathode) cards you want; place after the "M"; will be 0 to 5	
4 Choose the number of Dual Convection Gauge Cards; place after the "C"; each card runs two convection type gauges, will be 0 to 6	
5. If ordering Active Gauge (Analog Input) Cards, add "Ax" to the end of the part number, with the number of cards desired (1 to 6). Each card operates two Active Gauges.	XGS600HXMCCAXX
6. If ordering Profibus DP Option, add "P"	XGS600HXMCCAXXP

Note:

- The XGS-600 has 6 gauge card slots permitting a total of 6 cards.
- Up to four slots can be used for HFIG** cards. If four of these are chosen, one IMG* card or up to two Dual Convection Gauge Cards may be selected also.
- Up to five slots can be used for IMG* cards. If five of these are chosen, no additional gauge cards may be selected.
- All six slots may be used for Dual Convection Gauge Cards or Analog Input Cards.
- HFIG, IMG, and Dual Convection Cards can be used with Dual Analog Input Cards.

Agilent Gauges – Rough Vacuum

Agilent ConvecTorr Gauge

Dimensions: millimeters (inches)

Agilent's unique ConvecTorr gauge is a stainless steel, convection-enhanced thermal gauge, which maintains the sensing element at a constant temperature for superior performance from 10^{-4} Torr to atmospheric pressure. The ConvecTorr features accurate pressure indication over the entire rough vacuum range with extremely fast response time (0.2 seconds) and superior readings at higher vacuum pressures due to enhanced thermal stability. ConvecTorr is ideally suited for a wide range of demanding vacuum applications where accurate pressure monitoring and rapid, repetitive pump downs from atmosphere are required, such as load lock applications or control of a two-stage pump down. And, with excellent sensitivity near atmospheric pressure, ConvecTorr can often save many hours of pumping time when monitoring initial pumping of large vacuum systems.

The ConvecTorr, unlike other convection-type gauges, is not affected by system vibration and features a locking bayonet connector. The ConvecTorr offers continuous and repeatable pressure indications between 0 °C and 50 °C. The ConvecTorr is offered with a variety of mounting options and is easily interfaced with Agilent's XGS-600 gauge controller for integration in a complex vacuum system, or for use as a stand-alone pressure measurement tool.

Technical Specifications

Measurement range

1×10^{-4} Torr to atmosphere, 1×10^{-1} to 133 Pascal

Measurement precision

+ 30 % within a pressure decade

Temperature limits

Operating: 0 °C to 50 °C; storage: -15 to 80 °C; bake out: 80 °C with cable disconnected

Pressure response time

Less than 0.2 seconds

Materials

304 stainless steel with platinel filament and ABS housing

	L9090306	NW25 KF	0.5 (1.0)

Vacuum Measurement

Agilent 531 Thermocouple and 536 Baffled Thermocouple

Dimensions: millimeters (inches)

The 531 Thermocouple Gauge Tube is the time-proven, low-cost solution for continuous and accurate indication of rough vacuum pressure from 1×10^{-3} to 2.0 Torr (1×10^{-3} mbar to 2.7 mbar). Featuring rugged dependability and consistent operation unaffected by mounting orientation.

The 536 Thermocouple Gauge Tube is a welded 304 stainless steel version of the 531 with an additional baffle that greatly extends the sensor life when exposed to condensable gases in demanding applications. It provides a continuous and repeatable indication of pressures from 1×10^{-3} Torr to 2 Torr (1×10^{-3} mbar to 2.7 mbar). The thermocouple and heater are noble metal to minimize any possible affect of contaminants on gauge performance.

Both gauges are offered in a variety of mounting options and are easily interfaced with Agilent's XGS-600 gauge controller.

Agilent Gauges – High Vacuum

Agilent Thermocouple and ConvecTorr Gauge Simulators – Rough Vacuum

ConvecTorr and TC Gauge Simulators are designed to be convenient tools for verifying proper operation of the control unit. For those cases when the target gauge tube cannot be brought to proper pressure levels for true in-situ calibration, the simulator is used to ensure the control unit is calibrated to the average tube. The selectable "Vac" or "Atm" setting facilitates troubleshooting.

Vacuum Measurement

Agilent 572 Dual Tungsten Filament Bayard-Alpert Type Standard Range Ionization Gauge Tube

Dimensions: millimeters (inches)

The 572 is a high-performance gauge with a wide range of linear response: from 2×10^{-10} to 10^{-3} Torr. It is designed to withstand long periods of outgassing, and to facilitate simple external switching of filaments without disturbing the vacuum system. The 572 is compatible with virtually all modern hot filament ionization gauge controllers.

Agilent 563 Series Bayard-Alpert Type Standard Range Ionization Gauge Tube

Dimensions: millimeters (inches)

The 563 is a rugged gauge with wide range of linear response: 2×10^{-10} to 1×10^{-3} Torr. The platinum coating inside the bulb shields the gauge elements from electrostatic charges at low pressures and drains off the static charges which can build up at high pressures. The 563 is available in a variety of tubulations.

Agilent MBA-100/200 Bayard-Alpert Ion Gauges

Dimensions: millimeters (inches)

The MBA-100 is a compact, all-metal high-vacuum gauge for use where measurement precision and repeatability are equally important, for example laboratory vacuum systems, mass spectrometers, electron microscopes and scientific instruments. A heated filament provides a constant source of electrons for gas ionization, creating superior accuracy and stability, and a wide measurement range from 1×10^{-2} to 1×10^{-9} Torr. Agilent's unique etched-grid technology provides excellent gauge-to-gauge repeatability, and the small internal surface yields minimal outgassing to ensure accuracy and to protect your experimental process.

The MBA-100 is small and rugged to permit easy installation

in a closely packed system. The locking electrical connector ensures safe, positive contact, while the plastic housing protects people and nearby equipment from heat. A metal housing provides excellent shielding from electromagnetic interference (EMI) for superior gauge stability. The thoriated iridium filament resists burn out, even in the event of an accidental exposure to air. A dual filament model is available for the most critical applications; the spare filament will permit continued pressure measurement until the next scheduled maintenance period. The MBA-100 is easily interfaced with Agilent's XGS-600 controller for use as a stand-alone pressure measurement tool, or for integration into an experimental or process system.

Technical Specifications

Pressure range

1×10^{-2} to 1×10^{-9} Torr, 1.3 Pa to 1.3×10^{-7} Pa

Sensitivity

15/Torr

Measurement precision

+ 25% within a pressure decade

+ 10 % with STARRS Calibration

Emission current

1 milliamp max

Temperature limits

Operation: 0 °C to 850 °C; Storage: -15 to 80 °C

Bake out temperature

100 °C maximum with cable disconnected

Filament power

~3 watts, varies with pressure

Degas

E-Beam, 600 VDC @ 10 ma maximum

Materials

304 SST housing, flange & grid, thoriated iridium filament, tungsten collector

Connector

Series 2 Circular Plastic Connector, size 11-9 (glass filled nylon)

NOTE For vacuum pressure applications $< 10^{-8}$ Torr, a Conflat flange (CFF) is recommended.

Ordering Information

NOTE For information on a gauge controller and cables, please refer to the XGS-600 Controller section.

Vacuum Measurement

Agilent IMG-100 Inverted Magnetron Gauge

The IMG-100 is a rugged and accurate high vacuum gauge featuring a wide measurement range, fast starting time, good accuracy and superior repeatability in challenging environments. The IMG-100 is ideal for use in industrial applications such as metal deposition, glass coaters, vacuum furnaces, degassing ovens, and electron-beam welders.

The simple design requires no heated filament, so the IMG-100 has an excellent lifetime, is easily serviced, and is tolerant of sudden or frequent exposure to atmosphere. Further, there is less risk of heat from the gauge interfering with a critical experiment or process. The compact size allows flexible installation in any orientation, while the locking SHV high-voltage connector ensures safety and positive electrical contact. A precisely designed magnetic field constrains ionized gas molecules for accurate pressure measurement, so emission of stray electrons and photons is minimized.

The IMG-100 is easily interfaced with Agilent's XGS-600 gauge controller for integration into a variety of vacuum systems, or for use as a stand-alone pressure measurement tool.

Technical Specifications

Measurement range

1×10^{-3} Torr to 5×10^{-9} Torr, 1×10^{-1} Torr to 7×10^{-7} Pascal

Measurement precision

+ xx % within a pressure decade standard, + xx % with STARRS Calibration

Temperature limits

Operating: 0 °C to 80 °C; storage: -15 to 80 °C

Bake out temperature with Conflat flange

150 °C maximum with Cable Disconnected

Ignition response (starting time)

$T < 5$ seconds at pressures $< 1 \times 10^{-6}$ Torr

Materials exposed to vacuum

300 series stainless steel, nickel, glass (feedthrough)

Agilent IMG-300 UHV Inverted Magnetron Gauge

The IMG-300 inverted magnetron gauge combines excellent ultra-high vacuum measurement capability with fast pressure response. This sensor is optimized for UHV applications such as particle accelerators, synchrotron light beam lines and energy research applications, where stable UHV pressure measurement and fast pressure response are equally critical. Inverted magnetron gauges have no x-ray limit, so the ability to read extremely low pressure is limited only by the number of gas molecules present.

The magnetic design provides superior sensitivity at UHV pressures and ensures starting within 30 seconds at 1×10^{-10} Torr (millibar). With no hot filament, there is minimal outgassing from within the gauge that would degrade absolute accuracy of pressure response, and there is no electron or photon emission to disrupt an experimental process. The all-metal gauge design is radiation-resistant and bakeable

Technical Specifications

Vacuum Measurement

Agilent UHV-24 and UHV-24p Bayard-Alpert Ion Gauge

Dimensions: millimeters (inches)

The UHV-24 is a Bayard-Alpert ion gauge using Agilent's etched-grid structure to provide a broad operating pressure range with ionization effectiveness (sensitivity) at least 2 times that of other ionization gauges. The UHV-24 gauges excel in applications where superior measurement accuracy and repeatability of measurement are equally critical. The heated filament provides a constant source of electrons for ionization of gas molecules resulting in accurate and stable results. The precision collector limits X-ray current to a pressure equivalent of approximately 5×10^{-12} Torr (6.7×10^{-12} mbar).

The UHV-24P, an extended range version of the UHV-24, measures pressure from 5×10^{-12} Torr to 1×10^{-3} Torr

(6.7×10^{-12} mbar to 1×10^{-3} mbar). The UHV-24 and 24P feature a 2-3/4-inch ConFlat flange with long-life thoriated iridium or tungsten filaments that are easily replaceable in the field.

The UHV-24 and 24P are easily interfaced with Agilent's XGS-600 gauge controller for integration into a variety of vacuum systems, or for use as a stand-alone pressure measurement tool.

Active Gauges

Agilent CT-100 Active Rough Vacuum Gauge

Dimensions: millimeters (inches)

The Agilent CT-100 active rough vacuum gauge delivers Pirani gauge performance, at lower cost, in a simple, durable design. Rapid Response Pirani-like response time of 0.2 seconds makes the CT-100 ideal for high productivity applications where process steps are critically time-dependent. Rapid response time enables fast-acting valves to protect turbo pumps from sudden inrush of gas.

Two user-defined set points per gauge allow the triggering of multiple process steps, alarms, or other pressure-related conditions. Selectable pressure range offers accurate and repeatable readings precisely where it is most critical to the user.

CT-100 operates over the full rough pressure spectrum (1×10^{-4} Torr up to 100 Torr; 1.33×10^{-4} to 133 mbar; 1.33×10^{-2} Pa to 1.33×10^{-4} Pa), up to sensitivity to Atmosphere.

The long-life sensing element is designed three times thicker than a typical gauge, which minimizes sensitivity to process vibration, shock, and all condensables found in vacuum.

The robust sensing element results in longer life and higher repeatability making the CT-100 a more economical choice than traditional Pirani gauges. Single point calibration feature maintains gauge accuracy over time, unlike other gauges where more frequent replacement is required.

Features

- Selectable pressure range
- 0.2 second response time
- Two setpoints per gauge
- Thick sensing element
- Single point calibration offset
- Status LEDs

Benefits

- Provides accurate and repeatable readings
- Improves productivity and performance
- Enables cost and space savings
- Durable and reliable design
- Maintains gauge accuracy over time
- Quick visual indicator of vacuum status

Vacuum Measurement

Technical Specifications

Pressure range N₂/Air	Factory setting (1.000 V @ $\leq 1 \times 10^{-5}$ Torr): 1 x 10 ⁻⁴ to 100 Torr, sensitive to ATM (1.33 x 10 ⁻⁴ to 133 mbar, sensitive to ATM) (1.33 x 10 ⁻² to 1.33 x 10 ⁻⁴ Pa, sensitive to ATM) Optional User Setting (8.255 V @ ATM): 20 mTorr to ATM (2.6 x 10 ⁻² to 1000 mbar) (2.6 to 10 ⁻⁵ Pa)
Response time	0.2 second
Relay response time	<1 msec
Setpoint adjustment range	Greater than gauge pressure range
Operating temperature	15 °C to 50 °C, 90% relative humidity non-condensing
Storage temperature	-15 °C to 85 °C
Mounting orientation	Vacuum port pointing down for best results above 1 Torr (1.33 mbar, 133 Pa)
Weight with NPT Fitting	113 grams (¼ lb)
Interface	
Two setpoints	Two user defined pressure setpoints for process steps, alarms, high vacuum gauge trigger, or other pressure-induced events
Setpoint	Dual, non-isolated, open collector output
"Contact" Rating	0.3 VDC @ 100 mA (on), 30 VDC Max (off)
Adjustment	Trim pot, panel calibration, fixed hysteresis Analog voltage proportional to threshold available at connector (0 VDC – 12 VDC referred to analog output), output impedance 100 kohms

Input voltage/power	13 to 30 VDC @ 0.125 AMP, protected against reversals
Output signal (analog)	Non-linear, 1 to 9 VDC, nominal
Fault	<0.5 VDC or >9 VDC (for N ₂)
Output impedance	100 ohms
Displays	
Setpoint indicators	Red LEDs – Verify an operation is underway and the appropriate vacuum has been achieved
Vacuum indicator	Green LED – Indicates <100 mTorr vacuum is achieved
Materials of construction	
Materials exposed to vacuum	Nickel-plated mild steel, glass, nickel alloy (½" NPT) 304 SSt, glass, nickel alloy (NW16)
Casing	Flame retardant ABS (Acrylonitrile-butadiene-styrene)
Sensor element	Platinel
Sensor internal volume	5.4 mL
Connections	
Electrical	9-pin D-Sub
Hardware	¼" NPT or NW16 KF
Certification	UL Recognized, cUL Recognized
CE	EMC: EU 89/336, EN55011, EN61326 Safety: 73/23/EEC, Low Voltage Directive EN61010

Agilent PVG-500/PVG-500S/PVG-502S

Dimensions: millimeters (inches)

The Agilent PVG-500 series of Pirani gauges provides the ultimate combination of state-of-art technology and ruggedness within a compact design. The PVG-500 series utilizes the most advanced digital Pirani technology combined with a stainless steel sensor design to meet the various needs of the market today.

Features

- Compact, rugged aluminum housing that mounts in any orientation with a logarithmic signal output
- Stainless steel sensor cell with metal-sealed feedthrough
- Easy push button ATM and High Vacuum (HV) adjustment
- Nickel filament option
- Optional set points

Applications

- Fore pressure vacuum pressure monitoring
- Controlling high vacuum ionization gauges
- Safety monitoring in vacuum systems
- General vacuum measurement and control in the medium and rough vacuum range

Benefits

- Ease of integration
- Rugged design for a wide range of applications
- Ease of set-up
- Solution for corrosive applications
- Utilize pressure readings to perform critical operations

Active Gauges

Agilent CDG-500

The Agilent CDG-500 series of temperature compensated Capacitance Diaphragm gauges provides a high level of accuracy in the high pressure region. Full scale measurement ranges are available from 1000 Torr to 1 Torr. The CDG-500 series uses a corrosion resistant ultra pure alumina ceramic diaphragm providing exceptional signal stability, fast recovery from atmosphere, short warm-up times and unparalleled robustness.

Features

- Full scale ranges from 1 to 1000 Torr with push button zeroing and optional set point control
- Excellent long term signal stability and repeatability
- Fast recovery from atmospheric pressures and rapid stabilization after start-up
- Corrosion resistant ceramic sensor with sensor shielding protection

Applications

- General thin film and vacuum processes
- Industrial vacuum processes
- Data storage and display manufacturing
- Etch, CVD, PVD and other semiconductor production processes
- Reference sensor for monitoring of test instruments
- Transfer standard for traceability measurements

Benefits

- Ease of integration
- Long term performance – comparable to competitor's heated versions
- Reduces process cycle times
- Application robustness

Active Gauges

Agilent PCG-750/PCG-752

Dimensions: millimeters (inches)

The Agilent PCG-750 series of Pirani Capacitance Diaphragm gauges combines Agilent's Pirani and ceramic capacitance diaphragm sensors into a single design that provides gas-type independence with increased accuracy from Atm to 5×10^{-5} mbar (3.8×10^{-5} Torr).

Applications

- Fore pressure vacuum monitoring
- Safety monitoring in vacuum systems
- General vacuum measurement and control in the medium and rough vacuum range
- Load lock control

Features

- High accuracy and reproducibility at atmosphere
- Fast atmospheric detection
- Gas-type independent above 10 mbar
- Compact, rugged housing that mounts in any orientation with a logarithmic signal output
- Set point control
- Exchangeable plug and play sensor
- Nickel filament option
- Bright color LCD display option

Benefits

- Reliable atmospheric pressure monitoring
- Shortens process cycle times
- Allows safe venting with any gas mixture
- Ease of integration
- Utilize pressure readings to perform critical operations
- Easy to repair with low cost of ownership
- Solution for corrosive applications
- Monitor pressure readings easily

Vacuum Measurement

Active Gauges

Agilent FRG-700/FRG-702

Dimensions: millimeters (inches)

The Agilent FRG-700 and FRG-702 (all metal version) are full range gauges that provide two measuring technologies in a single, compact and economical package to measure process and base pressure from 5×10^{-9} mbar to atmosphere (3.8×10^{-9} Torr to atmosphere). The single, compact unit with one logarithmic analog output signal significantly reduces the complexity of installation, setup and integration. The benefit is reduced cost and reduction in valuable space requirements

Applications

- High vacuum pressure monitoring
- Base pressure for evaporation and sputtering systems
- General vacuum measurement and control in the medium and high vacuum range

Features

- Combination gauge – inverted magnetron and Pirani, with wide measurement range from 5×10^{-9} mbar to atmosphere
- No filament to burn out; easy to clean
- Excellent ignition properties
- Can be operated by a Agilent V-81 or V-301 rack controller and used with the TPS Compact and MiniTask
- LED indicator for high voltage on

Benefits

- Measures 9 decades using 1 compact gauge, 1 connection, 1 sensor cable and 1 A/D converter; reduces complexity and cost
- Low maintenance and reduced cost
- Rapid start-up
- Greatly reduces cost and space requirements
- Provides quick visual indication of status

Vacuum Measurement

Technical Specifications

Measurement range	5 x 10 ⁻⁹ to 1000 mbar (3.8 x 10 ⁻⁹ to 760 Torr)			
Accuracy	±30% of reading, typical			
Repeatability	±5% of reading, typical			
Mounting orientation	Any			
Admissible temperature	Operation (ambient) 5 to 55 °C	Storage -40 to +65 °C	Bake-out * (w/o electronics) 150 °C	Filament temperature (Pirani) 120 °C
Supply voltage	At gauge 15 to 30 VDC	Ripple ≤1 Vpp	Power consumption ≤2 W	
Output signal (measurement signal)	Voltage range 0 to 10.5 V		Measurement range 1.82 to 8.6 V	
Voltage vs. pressure	0.6 V/decade, logarithmic			
Error signal	<0.5 V (no supply), >9.5 V (Pirani sensor, filament rupture)			
Minimum loaded impedance	10 kΩ, short-circuit proof			
Response time	<10 ms (@ p> 10 ⁻⁶ mbar), ≈1000 ms (@ p= 10 ⁻⁸ mbar)			
Identification gauge	85 kΩ, referenced to supply common			
Status	Pirani-only mode 0 V (low)	Combined Pirani/cold cathode mode 15 V to 30 (high)		LED LED green high voltage on

Agilent FRG-720/FRG-730

Dimensions: millimeters (inches)

The Agilent FRG-720 and FRG-730 combine Agilent's Pirani and Bayard-Alpert sensor into a single compact design that provides measuring capability from 5×10^{-10} mbar to atmosphere (3.8×10^{-10} Torr to atmosphere). Combining these two technologies into a single unit reduces complexity and integration challenges while protecting the Bayard-Alpert sensor from premature burnout.

Applications

- Wide range from industrial coating and semiconductor processing to research and laboratory environments
- General vacuum measurement and control in the low to ultra-high vacuum range

Features

- Combination gauge – Bayard-Alpert and Pirani
- Pirani interlock
- Long-life yttrium oxide coated iridium filament
- Set point control
- LCD display option
- Profibus communication option

Benefits

- Wide measurement range from 5×10^{-10} mbar to atmosphere
- Protects Bayard-Alpert sensor from premature burnout and contamination effects from high pressure operation
- Rugged design for a wide range of applications
- Utilize pressure readings to perform critical operations
- Monitor pressure readings easily
- Ease of network integration

Dimensions: millimeters (inches)

AGC-100 is single channel controller compatible with the FRG 7xx, PVG-5xx, PCG-75x and CDG-500 series of active gauges and automatically identifies the active gauge connected.

AGD-100 is a low cost single channel display option for the FRG-700/702, PVG-5xx and PCG-75x series of active gauges. Both units have user selectable measurement unit (mbar, Torr, Pascal), and adjustable setpoint control.

Features

- Automatic identification of Agilent active gauges
- User selectable pressure units (mbar, Torr, Pascal)
- Adjustable setpoint control

Benefits

- Ease of setup
- Global compatibility
- Utilize pressure readings to perform critical operations

Agilent RGC-100

Dimensions: millimeters (inches)

The Agilent RGC-100 Rough Gauge Controller is a cost effective solution for pressure measurements in the 1×10^{-3} Torr to 760 Torr region.

The RGC-100 package includes the TC tube and cables to provide a pre-calibrated turnkey rough vacuum solution.

Features

- Thermocouple gauge – Agilent 531 – and controller are pre-calibrated as a set at the factory using a NIST standard
- Runs on 100-230 VAC, 50/60 Hz and displays in Torr or mbar
- Large bright LED display
- No moving parts
- Optional set point control
- Economical vacuum gauge

Applications

- General vacuum measurement and control in the rough vacuum range
- Monitor forelines, chamber evacuation and crossover to high vacuum pumps

Benefits

- No calibration required at initial setup
- Globally compatible
- Easily read from across a room, or in dimly lit locations
- Shock resistant and requires infrequent calibration
- Easily integrated
- Ideal choice for integrators

Agilent STARRS Calibration

STARRS Calibration and Service Program

Agilent introduces the STARRS Calibration and Service Program. STARRS is a total calibration, service and warranty program to ensure the optimum performance of your Agilent vacuum measurement equipment. Vacuum gauges are often overlooked in many systems, however, their accurate and reliable operation is critical to any process. Proper calibration on Agilent's state-of-the-art equipment will ensure that your gauges are accurate and repeatable. Our extended warranty and advanced exchange programs will eliminate downtime due to equipment problems. All of our calibration service is NIST-traceable and fully documented to meet exacting ISO standards.

The STARRS program encompasses a large number of options for calibration. We will calibrate new gauging on order from Agilent or your existing Agilent equipment. You may choose to have the gauges calibrated with the controllers or separately. In addition, you may choose a simple, inexpensive calibration or a more in-depth service. In many cases, a multi-million dollar process depends on a vacuum gauge and controller. For this reason, Agilent offers an advanced exchange program. This ensures that replacement equipment will be available to you right away should the need arise. Our extended warranty program offers peace of mind for all of your vacuum gauge instrumentation. 'The XGS line of gauge controllers has an advanced exchange program available. Due to the multiple configurations available, we encourage you to call Agilent to obtain the correct exchange part number for your product'

Vacuum Measurement

Sensitivity

Sensitivity is the most important parameter for an ion gauge. Also referred to as gauge factor, sensitivity is a measure of the ionization efficiency of a gauge. In order to understand the accuracy of an ion gauge, the sensitivity must be known. For a Bayard-Alpert gauge, the sensitivity may be calculated as follows:

$$S = \left(\frac{I^+}{I^-} \right) \left(\frac{1}{P} \right)$$

Where:

S = Sensitivity

I⁺ = Ion Current in Amperes (from collector)

I⁻ = Emission Current in Amperes (from filament)

P = Pressure in Torr

Using the above equation, sensitivity is expressed in “per Torr” units. Simply put, the higher the sensitivity, the better the resolution of the ion gauge. In order to accurately translate the ion current signal from a gauge into a pressure value, the sensitivity must be known. Typically, sensitivity values for gauges shown in manuals or marketing literature are average or “typical” values. In particular, older controllers used to operate these ion gauges are designed for this typical value. The actual sensitivity for a particular gauge tube may be significantly different from the published value, which will mean that your achieved accuracy will be much worse than expected. However, if the sensitivity of a gauge is known, then control electronics or the output signal may be adjusted accordingly.

Traceability

The status quo for most manufacturing operations is ISO 9000 compliance, meaning all procedures and products must be completely and accurately documented. Therefore, vacuum gauge calibrations must be properly documented in order to satisfy this requirement. It is important to use equipment which has been checked and adjusted against a standard reference. Agilent can supply ion gauges, Capacitance Diaphragm Gauges, and thermal rough vacuum gauges calibrated against NIST standards. In addition, Agilent maintains calibration records both electronically and on paper.

Accuracy

Accuracy is an issue often misunderstood in the vacuum environment. Accuracy is defined as measurement compared to a reference standard. Depending on the type of vacuum gauge, this value is quantified as a percentage of reading or full scale. For many vacuum applications such as high-energy physics research, accuracy must be known in order to ensure publishable results. By providing gauges calibrated against NIST-traceable standards, accuracy is quantified providing consistent data to the vacuum user.

Repeatability

In the production environment, repeatability is often more important than accuracy. In this context, repeatability is the ability of a vacuum measurement system to obtain the same reading after several process cycles. Excellent repeatability means consistent, high-quality end product from your process. Poor repeatability means downtime and extra cost.

Reliability

All applications demand a reliable vacuum measurement equipment. In many cases, a multi-million dollar process is dependent on a several hundred dollar vacuum gauge. Unnecessary downtime leads to unnecessary costs.

All Agilent vacuum gauge controllers and electronics have at least a one-year guarantee – and we will exchange or replace the component at your request. In order to provide extra peace of mind, Agilent will also arrange an advanced exchange program with your facility. Your local Agilent Vacuum Technologies sales engineer can provide details on this program.

Statistical Process Control

Agilent Vacuum Technologies is constantly seeking to maintain our quality and improve performance. For our broad line of vacuum gauging products, we have implemented a rigorous statistical process control (SPC) program to ensure consistent, reliable gauges. We track key performance characteristics and manufacturing parameters to maintain a high quality product.

Agilent Calibration Services Available

NIST-Traceable Gauge Only Calibration Rough Gauges (1mTorr to Atmosphere)

The Unit-Under-Test (UUT) Gauge will be operated with a NIST-calibrated Agilent controller and referenced against a suitable NIST-calibrated transfer-standard capacitance manometer. The customer will be given a four-point calibration sheet indicating the performance of the gauge relative to the standard, type number and serial number for transfer standard, and conditions at the time of test. Agilent CeramiCel Capacitance Diaphragm Gauges will be internally adjusted for optimum calibration. A “four-point” calibration provides UUT readings referenced against an NIST-standard at 25%, 50%, 75%, and 100% of full scale.

A “ten-point” calibration means reference data at 10%, 20%,... 100% of full scale.

NIST-Traceable System Calibration Includes Controller, Cables(s), Gauge(s)

All calibrations include documentation indicating equipment performance, environmental conditions, and NIST reference information.

NIST-Traceable Gauge Only Calibration High Vacuum and Ultra-High Vacuum Gauges

Gauge will be operated with a NIST-calibrated Agilent Controller. Two types of calibration will be available: standard, using a NIST-calibrated tube to determine a mid-range gauge factor (10^{-6}), and premium, which includes an SRG calibration down to the 10^{-6} Torr range and a NIST-tube calibration below this pressure. Premium service will include three gauge factor measurements – 10^{-4} Torr, 10^{-5} T and 10^{-6} Torr. Cost is per filament for hot-cathode gauges.

All calibrations include documentation indicating equipment performance, environmental conditions, and NIST reference information.

Description	Part Number*	Service Performed
Multi-Gauge Controller System Calibration	CALMG-1	Calibration of electronics using NIST-traceable equipment
For each thermocouple or ConvecTorr	CALCNTC-1	Calibration of gauges using electronics and cables provided. Includes sensitivity adjustment on Multi-Gauge to match ion gauge performance

Refer to ordering information above for Capacitance Diaphragm Gauge calibration part numbers.

Refer to ordering information above for Ion Gauge calibration part numbers.

senTorr Controller System Calibration	CALST-1	Calibration of electronics using NIST-traceable equipment
For each thermocouple or ConvecTorr	CALCNTC-1	Calibration of gauges using electronics and cables provided Includes sensitivity adjustment on senTorr to match ion gauge performance

Refer to ordering information above for Ion Gauge calibration part numbers.

CT-100 and Eyesys ConvecTorr Electronics and Gauge Calibration	CALEYECT-1	Calibration of transducer using NIST-traceable capacitance diaphragm gauge
Eyesys Mini-BA Electronics and Gauge Calibration (Standard Calibration)	CALYBAS-1	Calibration of transducer using NIST-traceable ion gauge. Includes sensitivity adjustment for optimum performance.
(Premium Calibration)	CALYBAP-1	Includes spinning rotor gauge reference
860 Cold Cathode Controller and Gauge Calibration	CAL860-1	Calibration of cold cathode gauge and controller using NIST-traceable ion gauge Documentation indicating results of testing and NIST reference data
ConvecTorr Analog Controller and Gauge Calibration	CALCVT-1	Calibration of ConvecTorr gauge and controller using NIST-traceable capacitance diaphragm gauge

- * **Note regarding part numbers**
- Part numbers listed above have been created specifically for new gauges purchased for calibration through this program.
 - When returning gauges for calibration to Agilent, add a "SER" prefix. Example: SER-CALCDG-1.

Vacuum Gauge Technical Notes

Historical Notes

Early interest in pressure measurement was stimulated in the 17th century by engineers who were concerned about the inability of suction pumps to remove water from mines. The pumps were limited to about 30 feet. For example, the Duke of Tuscany (Italy) commissioned Galileo to investigate the problem.

Galileo, among others, devised a number of experiments to investigate the properties of air. Among these experiments were pistons for measuring the “force of vacuum” and a water barometer that stood about 34 feet tall.

After Galileo’s death in 1642, the work was carried on by his associate, Evangelista Torricelli. Torricelli invented the mercury barometer (Figure 1) and he concluded that atmospheric air forced water up to a height of 33.6 feet.

Figure 1 - Mercury Barometer

Figure 1 Notes

- Air has weight...mass
 - 2 lbs. per cubic yard, or
 - 1.293 grams per liter
- Pressure = force per unit area
- The Barometer – At “standard conditions”, the height of the Hg column above the surface of the Hg in the dish will be 760 mm or 29.9 in. The density of mercury is 0.49 lbs. per cubic inch and, if the column is 29.9 in. high, it would then exert a force per unit area of $0.49 \times 29.9 = 14.7$ pounds/ in^2 .

The weight of the atmosphere exerts a force of 14.7 pounds per square inch on the surface of the Hg in the dish. The height of the mercury column is therefore a direct measure of the pressure and the unit of pressure is 1/760 of an atmosphere, which is called a Torr. The international pressure unit is Pascal, equal to one Newton per meter square.

In 1644, the French mathematician, Blaise Pascal, sent a group of mountaineers up into the Alps with a barometer and proved that air pressure decreased with altitude. The average height of the mercury column at sea level is 760 mm, and this

is defined as a standard atmosphere.

This also is 1.01×10^5 Pascals or 1.01×10^5 dynes cm^2 . The 1/760 of this value is called a Torr in honor of Torricelli.

An extension of the mercury barometer was the mercury U-tube manometer (Figure 2). Varying atmospheric pressures causes the mercury level to rise and fall in the “Torricellian Void.” Likewise, if the pressure at the other end of the tube is artificially reduced by a vacuum pump, the mercury in the tube falls drastically.

With both the barometer and the manometer, it is the difference in heights of the mercury levels that indicates the pressure, that is, the force (weight of Hg) per unit area that the air pressure will support. As the pressure on the system side is reduced, the height of the columns on either side of the U-tube approaches the same, and any difference becomes very difficult to measure (Figure 2).

Figure 2 - U-Tube Manometer

Many schemes were tried to magnify the very small differences that occurred at very low pressures, but the only one that really extended the range of the manometer was invented by H. McLeod in 1872. This gauge is an application of Boyle’s Law and is still in use today as a standard for calibrating secondary gauges (Figure 3).

Figure 3 - McLeod Gauge

Vacuum Measurement

Application of Boyle's Law

$$\begin{aligned}
 P_2 &= V_2 \\
 (P_1 + h) bh &= P_1 V_1 \\
 P_1 bh + bh^2 &= P_1 V_1 \\
 bh^2 &= P_1 V_1 - P_1 bh \\
 bh^2 &= P_1 (V_1 - bh) \\
 P_1 &= \frac{bh^2}{V_1 - bh}
 \end{aligned}$$

V_1 = Total volume, capillary plus bulb (cm^3)

P_1 = Pressure in system

b = Volum of capillary (in cubic cm)
mm length

h = Difference in height of mercury columns

$V_2 = bh$ (cm^3) volume in capillary

Figure 4 - Pressure Ranges of Various Vacuum Gauges

Applications

The vacuum gauges in use today mainly fall into three categories: mechanical, manometric, and electronic. Which gauge is used in a particular application generally depends on the pressure range it is intended to measure. Figure 4 shows useful pressure ranges of some typical gauges.

High pressures, such as those found in the rough pumping of a vacuum system, are generally measured with a thermocouple gauge. This instrument measures heat transfer rate from a heated wire. As gas is removed from the system, less heat is removed. The changes in temperature are measured by a thermocouple junction and its output is displayed as changes in pressure. The most useful pressure range for this gauge is from 5 Torr to 5 microns.

At lower pressures – from 1×10^{-2} Torr to 1×10^{-7} Torr – found

in many industrial applications, the cold cathode gauge is very useful. This instrument is basically a gaseous electric discharge cell which operates on the same principle as a diode-type ion pump. It is a rugged gauge that does not use a hot filament.

The most commonly used measurement device for high vacuum is the hot filament ionization gauge. This type of gauge can be designed to measure pressures as high as 5×10^{-1} Torr, and as low as 5×10^{-12} Torr. Since it is found in many industrial and scientific applications, it will be treated here in more detail.

Basic Performance Factors of Ionization Gauges

- 1. Reproducibility.** A gauge must be able to give reproducible readings for identical physical situations. Drift due to electric or geometric instabilities can have adverse effects on the measurement process.
- 2. Accuracy.** Gauges can be calibrated but, in general, their accuracy is limited to about $\pm 20\%$.
- 3. Sensitivity.** In the ion gauge, the positive ions that impact the collector (and pick up electrons from ground) account for the positive ion current (I^+).

The electrons emitted from the filament (I^-) produce the required ionization. The fundamental relationship is:

$$I^+ = (I^-)^{PK} \quad (1)$$

Where: (P) is the number of molecules present (Pressure)

And: (K) is the gauge constant which depends on the geometry of the device and the electrical parameters employed (K) is also referred to as the sensitivity (S), and:

$$S = \frac{I^+}{P \cdot I^-}$$

Where: Both (I^+) and (I^-) are measured in amperes and (P) is in Torr.

$$\text{Hence:} \quad S = \frac{(I^+) \text{ Amps}}{(I^-) \text{ Amps Torr}} = (\text{a number}) \text{ torr}$$

For instance, the sensitivity of the Agilent UHV-24 nude gauge is 25 per Torr.

Agilent Technical Notes

Operation of Ionization Gauges

Table 1 - Conversion Table

		Pascal (N/m ²) (Pa)	Torr	Standard Atmosphere (atm)	Millibar (mbar)	Dyne per Square Centimeter (dyne/cm ²)
1 Newton per square meter (N/m ²) = Pascal	=	1	7.5 x 10 ⁻³	9.87 x 10 ⁻⁶	10 ⁻²	10
1 Torr = 1 mm Hg	=	133	1	1.32 x 10 ⁻³	1.33	1,330
1 standard atmosphere (atm)	=	101,000	760	1	1,010	1,010,000
1 millibar (mbar)	=	100	0.75	9.87 x 10 ⁻⁶	1	1,000
1 dyne/square centimeter (dyne/cm ²)	=	10 ⁻¹	7.5 x 10 ⁻⁴	9.87 x 10 ⁻⁷	x 10 ⁻³	1

When an ionization gauge is used to measure pressure, two physically observable parameters are of interest; namely, emission current and ion current. These two currents must be observed simultaneously, and the pressure can be calculated by the following rule:

$$P = \frac{(I^+) 1}{(I^-) S}$$

I^+ = Observed ion current
 I^- = Observed emission current
 S = Gauge sensitivity (constant for any particular gauge)

Although the McLeod gauge uses mercury in a way different from the manometer, it still expresses pressure in terms of the height of a mercury column. At the pressures attained by modern vacuum systems, gauges that depend on the mechanical effects of pressure are ineffective. So, other means had to be found that could take advantage of other properties of atoms and molecules, such as heat conductivity or the ability to be ionized.

There are many ways to express pressure and some of the more common units are listed in Table 1.

The gauge sensitivity, S , is a function of the design and construction of the gauge. For the Agilent 563 Bayard-Alpert gauge, S has a nominal value of 10 Torr. For the Agilent 507 Triode gauge, S has a nominal value of 17 Torr.

One could use an instrument that measured both the I^+ and I^- currents with a high degree of accuracy. However, the absolute values of I^+ and I^- are unimportant in determining P ; only their ratio must be measured. Therefore, entirely equivalent results can be obtained with an instrument which measures I^+ as a fraction of I^- (a ratiometric instrument).

Table 2 - Pressure and Flow Unit

Pressures	
Standard atm	= 1.01325 x 10 ⁶ Dynes cm ⁻² = 760 mm Hg (at 0 °C) = 29.9213 in. of Hg (at 32 °F)
Bar	= 1 x 10 ⁶ Dynes cm ⁻² = 75.0062 cm Hg (at 0 °C) = 0.986 atm
Torr	= 1333 Dynes cm ⁻² = 1 mm Hg (at 0 °C) = (760) ⁻¹ Standard atm
Micron	= (length) 1000 Angstroms (1A = 10 ⁻¹⁰ meter) = (pressure) 1.33 Dyne cm ⁻² = (pressure) 1 x 10 ⁻³ Torr
Barye	= 1 Dyne cm ⁻² = 9.869 x 10 ⁻⁷ atm = 1 x 10 ⁻⁶ bar
Dyne	= Force necessary to give a one-gram mass an acceleration of one cm/sec/sec
Flows	
Cubic Foot	= 28.3 liters = 2.83 x 10 ⁴ cm ³
CFM	= 28.3 liters min ⁻¹ = 0.47 liter sec ⁻¹
Liter sec-1	= 2.12 cfm = 3.53 x 10 ⁻² cubic feet sec ⁻¹

Vacuum Measurement

It is convenient to maintain a constant emission current at a preselected value rather than to observe it for each measurement of pressure. Thus, in some gauge controls, the emission current is regulated at a nominal value of 9 ma (Bayard-Alpert) or 6 ma (triode). This value of emission leads to ion currents equal to 0.1 amp/Torr. During the calibration procedure, emission current is sensed by the electrometer amplifier and displayed on the panel meter. When the ion current is measured, the same amplifier and meter are used. Hence, the meter deflection observed during ion current measurement is automatically interpreted as a fraction of emission current, providing a true ratiometric measurement, even though the absolute value of emission current may be 20% different from nominal.

In conventional gauge controls, emission current is measured by the panel meter with suitable precision resistor shunts. The ion current is then amplified by an electrometer and displayed on the meter. Overall accuracy of this kind of system depends on the individual accuracies of the shunt resistors, the meter movement, and the electrometer gain. Since these items all function independently, the errors can add up.

However, in the Agilent ionization gauge controls, the electrometer and meter are always used together, whether measuring emission or ion currents. Thus, some of the errors are cancelled in the calibration process. As a result, the accuracy of the Agilent controls is not critically dependent on the tolerances of a large number of components, and long-term accuracy and repeatability are assured.

Some additional conversion factors for pressure and flow units are shown in Table 2.

Cold Cathode Gauges

The cold cathode gauge is an often overlooked, cost-effective gauge for ion implanters and other high-vacuum applications. A cold cathode gauge has no filament, is not subject to burnout and has a significantly longer life and lower annual replacement cost than a hot cathode Bayard-Alpert gauge. A cold-cathode gauge can be replaced at predictable intervals, whereas a hot cathode gauge must be replaced whenever a burnout occurs. In addition, the annual cost of replacement is less. A modern inverted magnetron cold cathode gauge is stable and can operate over a wide pressure range from 10 mTorr down to ultra-high vacuum. Repeatability is better than 98%. Cold cathode gauges have a reputation as 'slow starters,' since they must rely on an ionization source such as a cosmic ray to initiate a discharge. The lower the pressure, the less likely an ionizing collision and the longer the start delay. At 1 mTorr or higher, there is no delay; but at 10^{-8} Torr, starting can take up to 3 hours. The traditional solution is to start the gauge in the mTorr range, but often this is not practical. A relatively new technique uses ultraviolet induced photoemission to generate an ionizing electron to start the gauge.⁸ At 10^{-6} Torr the start time is 4-5 seconds.
